

Misc. Statistics

- **Employment Outlook Report** [Payroll Reporting in India: An Employment Perspective] (25th of each month)

Since April, 2018 Ministry has been bringing out the employment related statistics in the formal sector covering the period September 2017 onwards, using information on the number of subscribers who have subscribed under three major schemes, namely the Employees' Provident Fund (EPF) Scheme, the Employees' State Insurance (ESI) Scheme and the National Pension Scheme (NPS).

- Internationally accepted minimum age for which literacy data is for age 15 years and above
- Management Information System Organization (MISO) in Army HQ is the main statistical Organization in the Ministry of Defence. It is mainly engaged in the creation of databases on prices of important items in domestic and global markets, Exchange rates, allocation etc.
- Criteria for the selection of base year are:

The base year should preferably synchronise with the period of the income & expenditure survey and should not be very distant from the actual period of the survey. • Reliable price data should be available for the chosen period. • The base year should be a normal year i.e. a year in which there is no abnormalities in the price level and price variations. • The base year of the constituent centres should be uniform so as to facilitate easy and quick compilation of the All-India Index.

- DQAD has 6 data processing centres at : Delhi, Bangalore, Kolkata, Ahmedabad, Girdih and Nagpur.

- **Population Projections:**

-The Cohort Component Method is the universally accepted method of making population projections because growth of population is determined by fertility, mortality and migration rates. Twenty-one States and one UT have been considered and applied the Cohort Component method. They are Andhra Pradesh, Assam, Bihar, Chhattisgarh, NCT of Delhi, Gujarat, Haryana, Himachal Pradesh, Jammu & Kashmir (UT), Jharkhand, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Odisha, Punjab, Rajasthan, Tamil Nadu, Telangana, Uttarakhand, Uttar Pradesh and West Bengal. The projection of the seven north-eastern states (excluding Assam) has also been carried out as a whole using the Cohort Component Method. Based on the residual of the projected population of Jammu & Kashmir (State) and Jammu & Kashmir (UT), for which Cohort Component method has applied, projection of the Ladakh (UT) have been made.

-For the remaining state- Goa and UTs, Mathematical Method has been applied. The data used are 2011 Census and Sample Registration System (SRS). SRS provides time series data of fertility and mortality, which has been used for predicting their future levels.

- **Unorganised Sector's Data Problem**

-The unorganized non-agricultural segment of the economy, despite having a major contribution to the Gross Domestic Product, suffers from an irregular flow of current data. In the absence of regular data from official sources and annual enterprise surveys, the Gross Value Added (GVA) estimates in respect of unorganized segments of manufacturing and services sectors are compiled indirectly through labour input method using the benchmark-indicator procedure.

-For the purpose of data collection, manufacturing sector is broadly sub-divided into two categories i.e. organised (covering units coming under the Factories Act 1948) and unorganised. While data for organised manufacturing sector are collected through Annual Survey of Industries (ASI), the same for the residual non-factory unorganised manufacturing sector are collected periodically through NSS as follow-up surveys of Economic Censuses (EC). The unorganised manufacturing sector has roughly one-third share in the total contribution by the manufacturing sector in the GDP.

-In the case of the service sector, there is no Act under which the sector can be distinguished as organised and the residual as unorganised. For the organised service sector, units registered under Companies Act or Societies Act are considered as organised. In case of education, for instance, educational institutions whose salaries are funded by Government are considered as organised. The contribution of unorganized service sector to GDP is 30%.

-Data with respect to the unregistered manufacturing units or enterprises are collected through the periodic sample surveys. Apart from these sample surveys specifically designed to collect detailed data relating to employment, fixed assets, working capital, details of input and output, gross value added, etc. from the unregistered manufacturing enterprises, information on number of workers engaged in manufacturing activities are also available from three more sources namely, Employment-Unemployment Surveys (EUS) of the NSSO, decennial Population Censuses and the periodic Economic Censuses. The Economic Censuses also give information on the number of enterprises. It may be mentioned that employment data available from each of these three sources takes into account all types of workers irrespective of whether the employing enterprises are registered or unregistered in nature.

-Although there is no accurate definition of 'informal sector', the UN System of National Accounts (SNA) had broadly characterised the informal sector as consisting of units engaged in the production of goods and services with the primary objective of generating employment and incomes to the persons concerned. The production of units of the informal sector has the characteristics of a household enterprise. According to the classification adopted by the UN SNA, the production units owned by a single household or a group of households form part of the household sector as household enterprises or unincorporated enterprises.

-The terms "unorganized" and "informal" sectors are often used interchangeably. The informal sector may be broadly characterized as consisting of units engaged in the production of goods or services with the primary objective of generating employment and incomes to the persons concerned (15 ICLS, ILO, 1993). These units typically operate at a low level of organization, with little or no division between labour and capital as factors of production and on a small scale. Labour relations - where they exist - are based mostly on casual employment, kinship or personal and social relations rather than contractual arrangements with formal guarantees.

-The National Commission for Enterprises in the Unorganized Sector (NCEUS) was set up by the Government of India in 2004, to "review the status of unorganized/informal sector in India including the nature of enterprises, their size, spread and scope, and magnitude of employment". The Expert Group on Informal Sector Statistics, commonly known as the "Delhi Group", was set up in 1997 as one of the city groups of the United Nations Statistical Commission to address various methodological issues involved in the treatment of the informal sector.

- What is definition of Use-based categories in IIP classification?

The item groups in the new series of IIP have been categorized as per the following use- based classifications:

1. Primary goods: Only such goods as are directly obtained from natural sources and used for further processing and consumption in manufacturing and power-generating activities. This category has been created to replace the existing category "Basic goods" since the latter suffered from definitional ambiguity and overlapping coverage with other categories such as "Intermediate goods". E.g.: Ores and Minerals (incl. concentrates); Fuels (Diesel, Aviation Turbine Fuel, Kerosene, LPG, etc.) and Electricity.
2. Capital goods: Plants, machinery and goods used for further investments. E.g.: Boilers, Air & Gas Compressors, Engines including Internal Combustion and Diesel Engine, Tractors (complete), Transformers, Commercial Vehicles and all machineries like Textile Machinery, Printing Machinery etc.
3. Infrastructure/ construction goods: Finished goods which are primarily used in infrastructure industry or construction industry as an input. This category has been created to precisely categorise items which could not be classified under Consumer durables or Intermediate goods. E.g.: paints, cement, cables, bricks and tiles, rail materials, etc.
4. Intermediate goods: Any good/ product produced as incomplete product or which goes as input in production for further finishing or forming a part of a product. E.g.: Cotton yarn, Plywood, Steel Tubes/ Pipes, Fasteners, etc.
5. Consumer durables: Products directly used by consumers and having a longer durability (more than 2/3 years). E.g.: Pressure Cooker, Air Conditioners, Tyres, Telephone and mobile instruments, TV Sets, Passenger cars, Two-wheelers (motorcycles/ scooters), Jewellery of gold etc.
6. Consumer non-durables: Products that are directly used by consumers and can't be preserved for long periods. E.g.: Soyabean Oil, Full-cream/ Toned/ Skimmed milk, Milk Powder, Maida, Rice, Biscuits/ cookies, Sugar, Tea, Cigarettes, etc.
